Actional Diagnostics Cracked Accounts (AD) simplifies the creation of XML-based service and Web service projects. AD's module-based design supports the lifecycle of the service from creation to deployment. Developers, testers, operators and managers gain an overview of the service and its users' health through a dynamic visual presentation of events, events' correlation, queries and data. With more than 25 years of experience, AD offers the most complete set of testing capabilities for

new, existing and legacy services, and uses a single interface to manage both Web services and new XML-based service projects. The following features are part of the new Actional Diagnostics 2.0 release: · Service activity mapping · Service test automation · Service infrastructure · Service application monitoring · Automated service performance testing · Trusted integration of the interfaces of Actional Diagnostics to external systems · UML service class generation and custom service support

Actional Diagnostics 1.5 was released earlier in the year. It is a key element of the next generation of test management (TMTM), and it is coupled with TMTM, NuBit, and other available diagnostics platforms. Actional Diagnostics is a component of NuBit. It is an extension of NuBit testing capabilities. Actional Diagnostics is the first integrated toolkit that offers testing support through a comprehensive set of enterprise-ready, best-in-class testing tools for both Web services and new XML-based service projects. Having delivered Actional Diagnostics for the last five years, NuBit is a new name in the field of test management, service monitoring and service analytics. NuBit tooling helps you get the most value from your software development projects through better visibility into service testing and development, better performance tracking, better support for advanced requirements, better decision making through real-time analysis and better alignment of your teams. ## Actional Diagnostics

Actional Diagnostics for Microsoft.Net helps you to solve and document important problems early in the development lifecycle of web based services (including web services and web services in Mobile 3.0). The main goal of Actional Diagnostics is to enable you to find critical problems in a short time, without writing code and without fear of breaking your services during development. Actional Diagnostics provides you with:

- A code-free way to trace the process flow of any Microsoft.Net-based service, as well as the response times of all API operations exposed from it.
- A powerful diagnostic engine that helps you to find critical problems early in the development cycle, before you start writing production code.
- A well-documented framework that enables you to trace and analyze processes with detailed information such as service flow, response times, service and request parameters, error conditions, etc.
- An easy-to-use dashboard that provides a highly detailed view into service status, performance, and development progress. All features are accessible directly through a web browser, thereby eliminating the need for service licenses or additional software tools to access.

What are you waiting for? Myrtens also has an interesting insight concerning "diagnostic for.NET": Current.NET diagnostic tools offer ways to analyze and profile both managed and unmanaged code. However, they typically require prior knowledge of the application in question and it is generally assumed that the end user will have to understand the code base. Often this is not always possible. The reason I always try to find out about new technology is that I don't want to adapt to a technology I don't like. I want to be able to say: no, this is not okay, it's ugly, and now I'm going to change that. I see it as a strength of the open source community that it helps to constantly find out what people don't like. The long and the short of it is that Microsoft's new framework is good for several reasons, but I would first want to see what will happen, when end users want to run more mature applications in their browser. The Bottom Line. If you have the budget, then you can invest in a major software package: Visual Studio 2008 is around \$40,000, followed by a new version of Analysis Toolpack (ATP) at \$5,000; and all of the diagnostics stuff goes for about another \$3,000. It is all well
