Association of coronary atheroma with microalbuminuria in hypertensive patients. Microalbuminuria is an early marker of atherosclerosis. The purpose of this study was to determine whether or not microalbuminuria is associated with coronary artery atheroma. Fifty-eight hypertensive patients were enrolled in this study. They were examined for the presence of albuminuria by collection of 24-hour urine, and a control group of 22 normotensive patients was enrolled in this study. The hypertensive patients were divided into four groups, based on the degree of albuminuria, and had coronary artery calcification evaluated by multi detector computed tomography. The hypertensive patients with microalbuminuria had higher mean calcification score in coronary artery than the hypertensive patients with normoalbuminuria (0.59 ± 0.26 vs 0.45 ± 0.17 , $p < 0.05$).
