AutoCAD is one of the best-selling software programs for use in the design, development, and manufacturing of three-dimensional (3D) objects, a field known as additive manufacturing. Among the many advantages of 3D printing are the opportunity to print any type of material (including raw materials) in any shape and size, the speed at which printing can occur, and the ability to print on a layer-by-layer basis. The following is a list of the major features of AutoCAD. For an overview of AutoCAD capabilities and features, see AutoCAD Features & Options. Some of the features and functions available in AutoCAD are unique to the desktop version, while the mobile and web versions share many features. If you don't find the information you need in this section, you can look for it under Desktop in the app-specific help or on the AutoCAD web site. In AutoCAD, the commands that you perform are organized in "layers." A command is named for the type of object that it operates on, and the commands fall into several broad layers: Drawing, View, Modeling, and others. Drawing The Drawing layer contains commands for creating and editing drawing objects, including points, lines, curves, arcs, text, dimensions, tables, palettes, viewports, annotations, and other drawing objects. You can perform the following drawing-related tasks: Create a drawing object using commands from the Drawing tab.

If I then load it the object that I saved in the file is not the same object as the one I was working on in the code. How can I save the object? What do I have to do to make it the same as the one in code? A: Make sure your object implements Serializable and that you are using a single copy of the object. Serialization is not thread safe, you must do it within a single thread. If you do, or you have multiple threads running your program and try to serialize at the same time, you will corrupt the object. For example, SerializationService service = new SerializationService(); ObjectOutputStream out = new ObjectOutputStream(new FileOutputStream("c:\\foo.dat")); service.write(new Foo(), out); service.close(); Now if you do this while running your program you will see that it corrupts your data because the file foo.dat will be written to, but when your program reads it back in, it will not be the same data because it has not been deserialized yet.
