Syntax AutoCAD supports various syntaxes to specify what to draw. Vertex-by-Vertex and Face-by-Face: Drawing primitive objects consists of vertexes or faces. These primitives can be specified using various sets of coordinates. For example, "V v1, v2, v3" defines a closed curve and "F f1 f2 f3" defines a closed surface. Offset Point/Line/Angle: Drawing primitive objects can be specified using offset points (the starting point of the line is the last point), lines (the starting point of the line is the first point), and angles. Paths/Polylines/Polygons: Drawing primitives can be specified as polylines or polygons. Polylines are constructed using a series of connected points while polygons are a connected set of line segments. Arrows/Filled Arrows/Freehand: Drawing primitives can be defined with simple or filled lines, simple or filled arcs, or freehand lines. An arrow with a sharp end can be drawn by specifying a series of two lines that are connected by a point. A filled arrow is defined using a series of filled lines. A freehand arrow is defined using a series of points. Solid/Wireframe:

Drawing primitives can be specified as solid or wireframe. Solid lines (or surfaces) are defined using a series of connected line segments. Wireframe lines (or surfaces) are defined using a series of open line segments. Dimensions, text, annotations, and linetypes are specified with coordinates. Dimensions are specified in the drawing workspace (x,y) coordinates, whereas text and annotations are specified using absolute coordinates. Linetypes are specified using proportional or absolute coordinates. Hand-drawn graphic primitives, which are then manipulated with CAD commands such as the move and rotate functions, can also be used to create custom drawing templates. They can be defined using a series of simple arcs, lines, or curves. Animation of primitives AutoCAD has extensive primitives for drawing animations. With the drawing workspace, lines, curves, and arcs, AutoCAD provides a plethora of graphic primitives, which can be used to animate drawings. Through simple customization and/or programming, users are able to create a custom animation for various primitives using the drawing workspace. The creation of animation is also available via the command line using GsViewLite ca3bfb1094

Q: Why does only one cell react to "Cell.RowHeight = 0"? I am trying to completely empty out a row in a DataGridView, leaving only the header. I am trying this: However, the first two cells (first two columns) display correctly, but the third cell is still the size of the first cell's height and width. What am I doing wrong? I have tried putting the whole row in front of the first cell and I tried removing the height and width of the third cell before setting it to zero.

A: I think, the problem might be in your DisplayMember. If the DisplayMember is set to the header, but you change the row height to 0 then you set the DisplayMember to the 0 item in the data source. Therefore, the DisplayMember gets updated, and the cell height is no longer 0. Setting the DisplayMember to null removes the DisplayMember for the cell.

Killer whales have been rescued from a French trawler trawling for shark, and after many hours of drama and distress, their survival has been assured. A team from the Paris Zoological Park worked for an hour to get the whales to the surface and into the nets, and they had enough time to make the 30-minute trip back to shore before the nets dropped them again. Trawler operators feared the nets would keep the animals down, but the whales managed

to find the surface and somehow managed to free themselves from the nets. Bystanders and surfers witnessed the drama of the event, and Jacques Jacob, a marine biologist from the zoological park, was thrilled to have helped save their lives. He said: "One moment they were being attacked by huge sharks and the next moment they came to the surface." Trawler operators had sent their crew on a mission to trawl for sharks off the coast of the Dordogne in southwest France, however
