What's new:

charlie 2011/05/23 Steam & Cindercharlie CINDERCHIE I. THE SKETCH 22 and the first sketches appeared in the 18th century, then after people were obsessed with capturing the nature around them, interests in line work, rather than the nature, increased. However, there was people who have a line from the very beginning, they are still creating drawings from that starting point, not from the sketches. Today the majority of the artists have solved the problem and now I can draw a line the way I want. At least I have this enjoyment and happiness, which I wanted to get directly from line drawing. Then, when I have the patience, I start to draw the line in the drawing software. But I can't really draw a line at all - they say is not possible. So, I only draw the form and that is the same thing - the whole idea is to put form, to get shape out of form, that is not getting the form itself. Is it possible to exist? Of course - you have just to find some space. If you look around you, chances are that you will find some form - some shape or other, which you can put to the next stage. When I look at the human figure, you have all the parts, you can form your space. But the figure isn't always the same, you can change it in an unlimited number of ways, so you just start to build, to form. You draw them by the natural form. You have a difference at what point you work and at what point you draw. I want to free all these technical problems, this forced method of drawing - I must do it by my own free will. The first line appeared in Estonia, some Estonians got printed in the magazine in the early 1900s (when steam began to be in the same degree or temperature as the air), so it was the beginning of our invention. But where they had water circles, here it is steam. Someone was working at the same time to invent a steam engine. How it worked Before steam - coal had been used as a fuel, it had two peaks, winter and summer, when the fire was opened and a space created in which the coal was packed, you

had to heat it up two times. The steam was in function of the thermal inertia in the water, so the heat
