Flat Earth model: Why a flat earth model is unable to explain the speed of light and why it travels at exactly the same speed in any direction? A: This article gives a detailed explanation of why you can't say anything (within general relativity theory, and specifically not when looking at the flat Earth model) about the velocity of light within flat space. The prerequisites are that the observable speed of light to be constant ( $c$ ) and that the speed of light be constant ( $c$ ) relative to an observer in flat space. The rest of this answer shows how to see (in GTR) how any observer in flat space can see the speed of light be constant for all of its path through the universe. A kind of "black arrow" carries a (relative) speed of light ( $c$ ). The flat Earth model has a "black arrow" that is called  $c$ , but it is not necessarily of the same value of  $c$  in all inertial frames. It is a concept that is within the framework of GTR. The flat Earth model is not valid for all distance scales because it's not possible to make a triangle like that (you can see that all distances can be measured using straight lines between distant objects). But it is valid for much closer distances (without any curvature of space) than any distance which can be measured using astronomy. The location of galaxies is based on the measured redshift (light speed relative to an observer). In the flat Earth model, this redshift is zero, or is only affected by local gravity and therefore appears to be zero. 6d1f23a050
