After downloading the correct
software for your operating
system, use the search
function to find the program.
involved in the mutagenicity
of DF-1 cells which expressed
the Df and Df;Bov-p53
tumour suppressor genes. At
high DF-1 cell densities or
high DF-1 cell dose levels, the
expression of both genes was
associated with an increased
background activation of the

SOS response in the host DF-1 cells. All expression constructs were also tested for the ability to transform quail embryo fibroblasts. The increase in cell viability conferred by Df and Df;Bov-p53 in DF-1 cells was associated with a significant reduction in the frequency of transformation by reporter gene vectors. The complete amino acid sequence of a p53 protein, namely the p53 protein from rat cancer cells (wild-type form), has now

been deduced from the complete nucleotide sequence of the corresponding cDNA clone. This nucleotide sequence includes the first amino acid and the amino acid sequence for the first 24 amino acid residues of the wild-type p53 protein (examples of which are shown in FIGS. 1 and 2). It was demonstrated that the sequence of the first 24 amino acid residues of the wild-type p53 protein was identical to the sequence of

the first 24 amino acid residues of the mutant protein associated with cancer. The sequence of the first 24 amino acid residues of the wild-type p53 protein is: MTAR.sub.p53
MTR.sub.p53 DRV.sub.p53
N.sub.p53 A.sub.p53
F.sub.p53 Y.sub.p53
R.sub.p53 R.sub.p53 Y.sub.p
